MUTANT LUCIFERASES

TECHNICAL FIELD

This invention generally relates to luciferase
5 enzymes that produce luminescence, like that from
fireflies. More particularly, the invention concerns
mutant luciferases of beetles. The mutant luciferases of
the invention are made by genetic engineering, do not
occur in nature, and, in each case, include modifications
10 which cause a change in color in the luminescence that is
produced. The luciferases of the invention can be used,
like their naturally occurring counterparts, to provide
luminescent signals in tests or assays for various
substances or phenomena.

15

BACKGROUND OF THE INVENTION

The use of reporter molecules or labels to
qualitatively or quantitatively monitor molecular events
is well established. They are found in assays for
20 medical diagnosis, for the detection of toxins and other
substances in industrial environments, and for basic and
applied research in biology, biomedicine, and
biochemistry. Such assays include immunoassays, nucleic
acid probe hybridization assays, and assays in which a
25 reporter enzyme or other protein is produced by
expression under control of a particular promoter.
Reporter molecules, or labels in such assay systems, have
included radioactive isotopes, fluorescent agents,
enzymes and chemiluminescent agents.

30 Included in the assay system employing
chemiluminescence to monitor or measure events of
interest are assays which measure the activity of a
bioluminescent enzyme, luciferase.

Light-emitting systems have been known and
35 isolated from many luminescent organisms including
bacteria, protozoa, coelenterates, molluscs, fish,
millipedes, flies, fungi, worms, crustaceans, and
beetles, particularly click beetles of genus *Pyrophorus*
and the fireflies of the genera *Photinus*, *Photuris*, and

- 2 -

Luciola. In many of these organisms, enzymes catalyze monooxygenations and utilize the resulting free energy to excite a molecule to a high energy state. Visible light is emitted when the excited molecule spontaneously
5 returns to the ground state. This emitted light is called "bioluminescence." Hereinafter it may also be referred to simply as "luminescence."

The limited occurrence of natural bioluminescence is an advantage of using luciferase enzymes as reporter
10 groups to monitor molecular events. Because natural bioluminescence is so rare, it is unlikely that light production from other biological processes will obscure the activity of a luciferase introduced into a biological system. Therefore, even in a complex environment, light
15 detection will provide a clear indication of luciferase activity.

Luciferases possess additional features which render them particularly useful as reporter molecules for biosensing (using a reporter system to reveal properties
20 of a biological system). Signal transduction in biosensors (sensors which comprise a biological component) generally involves a two step process: signal generation through a biological component, and signal transduction and amplification through an electrical component.
25 Signal generation is typically achieved through binding or catalysis. Conversion of these biochemical events into an electrical signal is typically based on electrochemical or caloric detection methods, which are limited by the free energy change of the biochemical
30 reactions. For most reactions this is less than the energy of hydrolysis for two molecules of ATP, or about 70 kJ/mole. However, the luminescence elicited by luciferases carries a much higher energy content. Photons emitted from the reaction catalyzed by firefly
35 luciferase (560 nm) have 214 KJ/einstein. Furthermore, the reaction catalyzed by luciferase is one of the most efficient bioluminescent reactions known, having a

- 3 -

quantum yield of nearly 0.9. This enzyme is therefore an extremely efficient transducer of chemical energy.

Since the earliest studies, beetle luciferases, particularly that from the common North American firefly species *Photinus pyralis*, have served as paradigms for understanding of bioluminescence. The fundamental knowledge and applications of luciferase have been based on a single enzyme, called "firefly luciferase," derived from *Photinus pyralis*. However, there are roughly 1800 species of luminous beetles worldwide. Thus, the luciferase of *Photinus pyralis* is a single example of a large and diverse group of beetle luciferases. It is known that all beetle luciferases catalyze a reaction of the same substrate, a polyheterocyclic organic acid, D-(-)-2-(6'-hydroxy-2'-benzothiazolyl)- Δ^2 -thiazoline-4-carboxylic acid (hereinafter referred to as "luciferin", unless otherwise indicated), which is converted to a high energy molecule. It is likely that the catalyzed reaction entails the same mechanism in each case.

The general scheme involved in the mechanism of beetle bioluminescence appears to be one by which the production of light takes place after the oxidative decarboxylation of the luciferin, through interaction of the oxidized luciferin with the enzyme. The color of the light apparently is determined by the spatial organization of the enzyme's amino acids which interact with the oxidized luciferin.

The luciferase-catalyzed reaction which yields bioluminescence (hereinafter referred to simply as "the luciferase-luciferin reaction") has been described as a two-step process involving luciferin, adenosine triphosphate (ATP), and molecular oxygen. In the initial reaction, the luciferin and ATP react to form luciferyl adenylate with the elimination of inorganic pyrophosphate, as indicated in the following reaction:

- 4 -

where E is the luciferase, LH_2 is luciferin, and PPi is pyrophosphate. The luciferyl adenylate, $\text{LH}_2\text{-AMP}$, remains tightly bound to the catalytic site of luciferase. When this form of the enzyme is exposed to molecular oxygen, the enzyme-bound luciferyl adenylate is oxidized to yield oxyluciferin ($\text{L}=\text{O}$) in an electronically excited state. The excited oxidized luciferin emits light on returning to the ground state as indicated in the following reaction:

$$\downarrow$$

One quantum of light is emitted for each molecule of luciferin oxidized. The electronically excited state of the oxidized luciferin is a characteristic state of the luciferase-luciferin reaction of a beetle luciferase; the color (and, therefore, the energy) of the light emitted upon return of the oxidized luciferin to the ground state is determined by the enzyme, as evidenced by the fact that various species of beetles having the same luciferin emit differently colored light.

Luciferases have been isolated directly from various sources. The cDNAs encoding luciferases of various beetle species have been reported. (See de Wet et al., *Molec. Cell. Biol* 7, 725 - 737 (1987); Masuda et al., *Gene* 77, 265 - 270 (1989); Wood et al., *Science* 244, 700 - 702 (1989)). With the cDNA encoding a beetle luciferase in hand, it is entirely straightforward for the skilled to prepare large amounts of the luciferase by isolation from bacteria (e.g., *E. coli*), yeast, mammalian cells in culture, or the like, which have been transformed to express the cDNA. Alternatively, the cDNA, under control of an appropriate promoter and other

- 5 -

signals for controlling expression, can be used in such a cell to provide luciferase, and ultimately bioluminescence catalyzed thereby, as a signal to indicate activity of the promoter. The activity of the promoter may, in turn, reflect another factor that is sought to be monitored, such as the concentration of a substance that induces or represses the activity of the promoter. Various cell-free systems, that have recently become available to make proteins from nucleic acids encoding them, can also be used to make beetle luciferases.

Further, the availability of cDNAs encoding beetle luciferases and the ability to rapidly screen for cDNAs that encode enzymes which catalyze the luciferase-luciferin reaction (see de Wet et al., supra and Wood et al., supra) also allow the skilled to prepare, and obtain in large amounts, other luciferases that retain activity in catalyzing production of bioluminescence through the luciferase-luciferin reaction. These other luciferases can also be prepared, and the cDNAs that encode them can also be used, as indicated in the previous paragraph. In the present disclosure, the term "beetle luciferase" or "luciferase" means an enzyme that is capable of catalyzing the oxidation of luciferin to yield bioluminescence, as outlined above.

The ready availability of cDNAs encoding beetle luciferases makes possible the use of the luciferases as reporters in assays employed to signal, monitor or measure genetic events associated with transcription and translation, by coupling expression of such a cDNA, and consequently production of the enzyme, to such genetic events.

Firefly luciferase has been widely used to detect promoter activity in eucaryotes. Though this enzyme has also been used in procaryotes, the utility of firefly luciferase as genetic reporter in bacteria is not commonly recognized. As genetic reporters, beetle

- 6 -

luciferases are particularly useful since they are monomeric products of a single gene. In addition, no post-translational modifications are required for enzymatic activity, and the enzyme contains no prosthetic groups, bound cofactors, or disulfide bonds.

5 Luminescence from E.coli containing the gene for firefly luciferase can be triggered by adding the substrate luciferin to the growth medium. Luciferin readily penetrates biological membranes and cannot be used as a

10 carbon or nitrogen source by E.coli. The other substrates required for the bioluminescent reaction, oxygen and ATP, are available within living cells. However, measurable variations in luminescence color from

15 luciferases would be needed for systems which utilize two or more different luciferases as reporters (signal geneators).

Clones of different beetle luciferases, particularly of a single genus or species, can be utilized together in bioluminescent reporter systems.

20 Expression in exogenous hosts should differ little between these luciferases because of their close sequence similarity. Thus, in particular, the click beetle luciferases may provide a multiple reporter system that can allow the activity of two or more different promoters

25 to be monitored within a single host, or for different populations of cells to be observed simultaneously. The ability to distinguish each of the luciferases in a mixture, however, is limited by the width of their emissions spectra.

30 One of the most spectacular examples of luminescence color variation occurs in *Pyrophorus plagiophthalmus*, a large click beetle indigenous to the Caribbean. This beetle has two sets of light organs, a pair on the dorsal surface of the prothorax, and a single

35 organ in a ventral cleft of the abdomen. Four different luciferase clones have been isolated from the ventral organ. The luciferin-luciferase reactions catalyzed by

- 7 -

these enzymes produces light that ranges from green to orange.

Spectral data from the luciferase-luciferin reaction catalyzed by these four luciferases show four
5 overlapping peaks of nearly even spacing, emitting green (peak intensity: 546 nanometers), yellow-green (peak intensity: 560 nanometers), yellow (peak intensity: 578 nanometers) and orange (peak intensity: 593 nanometers) light. The respective proteins are named LucPplGR,
10 LucPplyG, LucPplyE and LucPplOR. Though the wavelengths of peak intensity of the light emitted by these luciferases range over nearly 50 nm, there is still considerable overlap among the spectra, even those with peaks at 546 and 593 nm. Increasing the difference in
15 wavelength of peak intensity would thus be useful to obtain greater measurement precision in systems using two or more luciferases.

The amino acid sequences of the four luciferases from the ventral organ are highly similar. Comparisons
20 of the sequences show them to be 95 to 99% identical.

It would be desirable to enhance the utility of beetle luciferases for use in systems using multiple reporters to effect mutations in luciferase-encoding cDNAs to produce mutant luciferases which, in the
25 luciferase-luciferin reaction, produce light with differences between wavelengths of peak intensity that are greater than those available using currently available luciferases.

Beetle luciferases are particularly suited for
30 producing these mutant luciferases since color variation is a direct result of changes in the amino acid sequence.

Mutant luciferases of fireflies of genus *Luciola* are known in the art. Kajiyama et al., U.S. Patent Nos. 5,219,737 and 5,229,285.

35 In using luciferase expression in eukaryotic cells for biosensing, it would be desirable to reduce transport of the luciferase to peroxisomes. Sommer et

- 8 -

al., Mol. Biol. Cell 3, 749 - 759 (1992), have described mutations in the three carboxy-terminal amino acids of *P. pyralis* luciferase that significantly reduce peroxisome-targeting of the enzyme.

- 5 The sequences of cDNAs encoding various beetle luciferases, and the amino acid sequences deduced from the cDNA sequences, are known, as indicated in Table I.

The cDNA and amino acid sequences of LucPplGR, the green-emitting luciferase of the elaterid beetle *Pyrophorus plagiophthalmus*, are shown in SEQ ID NO:1.

5 SUMMARY OF THE INVENTION

The present invention provides mutant luciferases of beetles and DNAs which encode the mutant luciferases. Preferably, the mutant luciferases produce a light of different color from that of the corresponding wild-type
10 luciferase and preferably this difference in color is such that the wavelength of peak intensity of the luminescence of the mutant differs by at least 1 nm from that of the wild-type enzyme.

The mutant luciferases of the invention differ
15 from the corresponding wild-type enzymes by one or more, but typically fewer than three, amino acid substitutions. The luciferases of the invention may also entail changes in one or more of the three carboxy-terminal amino acids to reduce peroxisome targeting.

20 In one surprising aspect of the invention, it has been discovered that combining in a single mutant two amino acid substitutions, each of which, by itself, occasions a change in color (shift in wavelength of peak intensity) of bioluminescence, causes the mutant to have
25 a shift in wavelength of peak intensity that is greater than either shift caused by the single amino acid substitutions.

CDNAs encoding the mutant luciferases of the invention may be obtained straightforwardly by any
30 standard, site-directed mutagenesis procedure carried out with a cDNA encoding the corresponding wild-type enzyme or another mutant. The mutant luciferases of the invention can be made by standard procedures for expressing the cDNAs which encode them in prokaryotic or
35 eukaryotic cells.

- 10 -

A fuller appreciation of the invention will be gained upon examination of the following detailed description of the invention.

5 DETAILED DESCRIPTION OF THE INVENTION

In the following description and examples, process steps are carried out and concentrations are measured at room temperature (about 20 °C to 25 °C) and atmospheric pressure unless otherwise specified.

10 All amino acids referred to in the specification, except the non-enantiomorphic glycine, are L-amino acids unless specified otherwise. An amino acid may be referred to using the one-letter or three-letter designation, as indicated in the following Table II.

15

Table II			
Designations for Amino Acids			
	Amino Acid	Three-Letter Designation	One-Letter Designation
20	L-alanine	Ala	A
	L-arginine	Arg	R
	L-asparagine	Asn	N
	L-aspartic acid	Asp	D
	L-cysteine	Cys	C
25	L-glutamic acid	Glu	E
	L-glutamine	Gln	Q
	glycine	Gly	G
	L-histidine	His	H
	L-isoleucine	Ile	I
30	L-leucine	Leu	L
	L-lysine	Lys	K
	L-methionine	Met	M
	L-phenylalanine	Phe	F
	L-proline	Pro	P
35	L-serine	Ser	S
	L-threonine	Thr	T
	L-tryptophan	Trp	W
	L-tyrosine	Tyr	Y
	L-valine	Val	V

40 "X" means any one of the twenty amino acids listed in Table II.

Peptide or polypeptide sequences are written and numbered from the initiating methionine, which is numbered "1," to the carboxy-terminal amino acid.

- 11 -

A substitution at a position in a polypeptide is indicated with [designation for original amino acid]_[position number][designation for replacing amino acid]. For example, substitution of an alanine at position 100 in a polypeptide with a glutamic acid would be indicated by Ala₁₀₀Glu or A₁₀₀E. Typically, the substitution will be preceded by a designation for the polypeptide in which the substitution occurs. For example, if the substitution A₁₀₀E occurs in an hypothetical protein designated "Luck," the substitution would be indicated as Luck-Ala₁₀₀Glu or Luck-A₁₀₀E. If there is more than one substitution in a polypeptide, the indications of the substitutions are separated by slashes. For example, if the hypothetical protein "Luck" has a substitution of glutamic acid for alanine at position 100 and a substitution of asparagine for lysine at position 150, the polypeptide with the substitutions would be indicated as Luck-Ala₁₀₀Glu/Lys₁₅₀Asn or Luck-A₁₀₀E/K₁₅₀N. To indicate different substitutions at a position in a polypeptide, the designations for the substituting amino acids are separated by commas. For example, if the hypothetical "Luck" has substitutions of glutamic acid, glycine or lysine for alanine at position 100, the designation would be Luck-Ala₁₀₀/Glu,Gly,Lys or Luck-A₁₀₀/E,G,K.

The standard, one-letter codes "A," "C," "G," and "T" are used herein for the nucleotides adenylate, cytidylate, guanylate, and thymidylate, respectively. The skilled will understand that, in DNAs, the nucleotides are 2'-deoxyribonucleotide-5'-phosphates (or, at the 5'-end, triphosphates) while, in RNAs, the nucleotides are ribonucleotide-5'-phosphates (or, at the 5'-end, triphosphates) and uridylate (U) occurs in place of T. "N" means any one of the four nucleotides.

Oligonucleotide or polynucleotide sequences are written from the 5'-end to the 3'-end.

The term "mutant luciferase" is used herein to refer to a luciferase which is not naturally occurring

- 12 -

and has an amino acid sequence that differs from those of naturally occurring luciferases.

In one of its aspects, the present invention is a mutant beetle luciferase which produces bioluminescence (i.e., catalyzes the oxidation of luciferin to produce bioluminescence) which has a shift in wavelength of peak intensity of at least 1 nm from the wavelength of peak intensity of the bioluminescence produced by the corresponding wild-type luciferase and has an amino acid sequence that differs from that of the corresponding wild-type luciferase by a substitution at one position or substitutions at two positions; provided that, if there is a substitution at one position, the position corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting of position 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248, 282, 283 and 348; provided further that, if there are substitutions at two positions, at least one of the positions corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting of position 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248, 282, 283 and 348; and provided that the mutant optionally has a peroxisome-targeting-avoiding sequence at its carboxy-terminus.

Exemplary mutant luciferases of the invention are those of the group consisting of LucPplGR-R₂₁₅H, -R₂₁₅G, -R₂₁₅T, -R₂₁₅M, -R₂₁₅P, -R₂₁₅A, -R₂₁₅L, -R₂₂₃L, -R₂₂₃Q, -R₂₂₃M, -R₂₂₃H, -V₂₂₄I, -V₂₂₄S, -V₂₂₄F, -V₂₂₄Y, -V₂₂₄L, -V₂₂₄H, -V₂₂₄G, -V₂₃₂E, -V₂₃₆H, -V₂₃₆W, -Y₂₃₇S, -Y₂₃₇C, -L₂₃₈R, -L₂₃₈M, -L₂₃₈Q, -L₂₃₈S, -L₂₃₈D, -H₂₄₂A, -F₂₄₄L, -G₂₄₅S, -G₂₄₅E, -S₂₄₇H, -S₂₄₇T, -S₂₄₇Y, -S₂₄₇F, -I₂₄₈R, -I₂₄₈V, -I₂₄₈F, -I₂₄₈T, -I₂₄₈S, -I₂₄₈N, -H₃₄₈N, -H₃₄₈Q, -H₃₄₈E, -H₃₄₈C, -S₂₄₇F/F₂₄₆L, -S₂₄₇F/I₂₄₈C, -S₂₄₇F/I₂₄₈T, -V₂₂₄F/R₂₁₅G, -V₂₂₄F/R₂₁₅T, -V₂₂₄F/R₂₁₅V, -V₂₂₄F/R₂₁₅P, -V₂₂₄F/P₂₂₂S, -V₂₂₄F/Q₂₂₇E, -V₂₂₄F/L₂₃₈V, -V₂₂₄F/L₂₃₈T, -V₂₂₄F/S₂₄₇G, -V₂₂₄F/S₂₄₇H, -V₂₂₄F/S₂₄₇T, and -V₂₂₄F/S₂₄₇F.

The following Table III shows spectral properties of these and other exemplary mutant luciferases.

"Corresponding positions" in luciferases other than LucPplGR can be determined either from alignments at the amino acid level that are already known in the art (see, e.g., Wood et al., Science 244, 700 - 702 (1989);
5 Devine et al., Biochim. et Biophys. Acta 1173, 121-132(1993)) or by simply aligning at the amino acid level to maximize alignment of identical or conservatively substituted residues, and keeping in mind in particular that amino acids 195 - 205 in the LucPplGR sequence are
10 very highly conserved in all beetle luciferases and that there are no gaps for more than 300 positions after that highly conserved 11-mer in any beetle luciferase amino acid sequence.

A "peroxisome-targeting-avoiding sequence at its
15 carboxy-terminus" means (1) the three carboxy-terminal amino acids of the corresponding wild-type luciferase are entirely missing from the mutant; or (2) the three carboxy-terminal amino acids of the corresponding wild-type luciferase are replaced with a sequence, of one, two
20 or three amino acids that, in accordance with Sommer et al., supra, will reduce peroxisome-targeting by at least 50 %. If the three carboxy-terminal amino acids of the wild-type luciferase are replaced by a three-amino-acid peroxisome-targeting-avoiding sequence in the mutant, and
25 if the sequence in the mutant is $X_1X_2X_3$, where X_1 is carboxy-terminal, than X_1 is any of the twenty amino acids except A, C, G, H, N, P, Q, T and S, X_2 is any of the twenty amino acids except H, M, N, Q, R, S and K, and X_3 is any of the twenty amino acids except I, M, Y and L.
30 Further, any one or two, or all three, of X_1 , X_2 , and X_3 could be absent from the mutant (i.e., no amino acid corresponding to the position). The most preferred peroxisome-targeting-avoiding sequence is IAV, where V is at the carboxy-terminus.

35 In another of its aspects, the invention entails a combination of luciferases, in a cell (eukaryotic or prokaryotic), a solution (free or linked as a reporter to

- 18 -

an antibody, antibody-fragment, nucleic acid probe, or the like), or adhered to a solid surface, optionally through an antibody, antibody fragment or nucleic acid, and exposed to a solution, provided that at least one of the luciferases is a mutant, both of the luciferases remain active in producing bioluminescence, and the wavelengths of peak intensities of the bioluminescence of the luciferases differ because the amino acid sequences of the luciferases differ at at least one of the positions corresponding to positions 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248, 282, 283 and 348 in the amino acid sequence of LucPplGR, provided that one or both of the luciferases optionally have peroxisome-targeting-avoiding sequences.

In another of its aspects, the invention entails a DNA molecule, which may be an eukaryotic or prokaryotic expression vector, which comprises a segment which has a sequence which encodes a mutant beetle luciferase of the invention.

Most preferred among the DNAs of the invention are those with segments which encode a preferred mutant luciferase of the invention.

From the description of the invention provided herein, the skilled will recognize many modifications and variations of what has been described that are within the spirit of the invention. It is intended that such modifications and variations also be understood as part of the invention.

SEQUENCE LISTING

(1) GENERAL INFORMATION:

- (i) APPLICANT: Promega Corporation
- (ii) TITLE OF INVENTION: Mutant Luciferases

CLAIMS

1. A mutant beetle luciferase which has an amino acid sequence that differs from that of the corresponding wild-type luciferase by a substitution at one position or
5 substitutions at two positions; provided that, if there is a substitution at one position, the position corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting of position
214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245,
10 247, 248, 282, 283 and 348; and provided further that, if there are substitutions at two positions, at least one of the positions corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting
of position 214, 215, 223, 224, 232, 236, 237, 238, 242,
15 244, 245, 247, 248, 282, 283 and 348.

2. A mutant luciferase according to Claim 1 wherein there is one amino acid substitution.

3. A mutant luciferase according to Claim 1 wherein there are two amino acid substitutions.

20 4. A mutant luciferase according to Claim 3 wherein each of the amino acid substitutions is at a position corresponding to a position in the amino acid sequence of LucPplGR selected from the group consisting
of position 214, 215, 223, 224, 232, 236, 237, 238, 242,
25 244, 245, 247, 248, 282, 283 and 348.

5. A mutant luciferase according to Claim 1 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, LucPplOR, the luciferase of *Photinus pyralis*,
30 the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the luciferase of *Luciola mingrelica*.

6. A mutant luciferase according to Claim 2 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, LucPplOR, the luciferase of *Photinus pyralis*,
5 the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the luciferase of *Luciola mingrellica*.

7. A mutant luciferase according to Claim 3 wherein the corresponding wild-type luciferase is
10 selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, LucPplOR, the luciferase of *Photinus pyralis*, the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the luciferase of *Luciola mingrellica*.

15 8. A mutant luciferase according to Claim 4 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, LucPplOR, the luciferase of *Photinus pyralis*, the luciferase of *Luciola cruciata*, the luciferase of
20 *Luciola lateralis*, and the luciferase of *Luciola mingrellica*.

9. A mutant luciferase according to Claim 5 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, and LucPplOR.
25

10. A mutant luciferase according to Claim 6 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, and LucPplOR.

30 11. A mutant luciferase according to Claim 7 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, and LucPplOR.

12 A mutant luciferase according to Claim 8
35 wherein the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplYG, LucPplYE, and LucPplOR.

13. A mutant luciferase of Claim 9 wherein the corresponding wild-type luciferase is LucPplGR.

14. A mutant luciferase of Claim 10 wherein the corresponding wild-type luciferase is LucPplGR.

5 15. A mutant luciferase of Claim 11 wherein the corresponding wild-type luciferase is LucPplGR.

16. A mutant luciferase of Claim 12 wherein the corresponding wild-type luciferase is LucPplGR.

10 17. A mutant luciferase of Claim 13 wherein the mutant is selected from the group consisting of
 LucPplGR-R₂₁₅H, -R₂₁₅G, -R₂₁₅T, -R₂₁₅M, -R₂₁₅P, -R₂₁₅A, -R₂₁₅L,
 -R₂₂₃L, -R₂₂₃Q, -R₂₂₃M, -R₂₂₃H, -V₂₂₄I, -V₂₂₄S, -V₂₂₄F, -V₂₂₄Y, -V₂₂₄L,
 -V₂₂₄H, -V₂₂₄G, -V₂₃₂E, -V₂₃₆H, -V₂₃₆W, -Y₂₃₇S, -Y₂₃₇C, -L₂₃₈R, -L₂₃₈M,
 -L₂₃₈Q, -L₂₃₈S, -L₂₃₈D, -H₂₄₂A, -F₂₄₄L, -G₂₄₅S, -G₂₄₅E, -S₂₄₇H, -S₂₄₇T,
 15 -S₂₄₇Y, -S₂₄₇F, -I₂₄₈R, -I₂₄₈V, -I₂₄₈F, -I₂₄₈T, -I₂₄₈S, -I₂₄₈N, -H₃₄₈N,
 -H₃₄₈Q, -H₃₄₈E, -H₃₄₈C, -S₂₄₇F/F₂₄₆L, -S₂₄₇F/I₂₄₈C, -S₂₄₇F/I₂₄₈T,
 -V₂₂₄F/R₂₁₅G, -V₂₂₄F/R₂₁₅T, -V₂₂₄F/R₂₁₅V, -V₂₂₄F/R₂₁₅P, -V₂₂₄F/P₂₂₂S,
 -V₂₂₄F/Q₂₂₇E, -V₂₂₄F/L₂₃₈V, -V₂₂₄F/L₂₃₈T, -V₂₂₄F/S₂₄₇G, -V₂₂₄F/S₂₄₇H,
 -V₂₂₄F/S₂₄₇T, and -V₂₂₄F/S₂₄₇F.

20 18. A DNA molecule which comprises a segment which has a sequence which encodes a mutant beetle luciferase which has an amino acid sequence that differs from that of the corresponding wild-type luciferase by a substitution at one position or substitutions at two
 25 positions; provided that, if there is a substitution at one position, the position corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting of position 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248, 282, 283 and 348;
 30 and provided further that, if there are substitutions at two positions, at least one of the positions corresponds to a position in the amino acid sequence of LucPplGR selected from the group consisting of position 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248,
 35 282, 283 and 348.

19. A DNA molecule according to Claim 18 wherein the encoded mutant luciferase has one amino acid substitution.

20. A DNA molecule according to Claim 18 wherein
5 the encoded mutant luciferase has two amino acid substitutions.

21. A DNA molecule according to Claim 20 wherein, in the encoded mutant luciferase, each of the amino acid substitutions is at a position corresponding to a
10 position in the amino acid sequence of LucPplGR selected from the group consisting of position 214, 215, 223, 224, 232, 236, 237, 238, 242, 244, 245, 247, 248, 282, 283 and 348.

22. A DNA molecule according to Claim 18 wherein,
15 for the encoded amino acid sequence, the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplyG, LucPplyE, LucPplOR, the luciferase of *Photinus pyralis*, the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the
20 luciferase of *Luciola mingrelica*.

23. A DNA molecule according to Claim 19 wherein, for the encoded amino acid sequence, the corresponding wild-type luciferase is selected from the group consisting of LucPplGR, LucPplyG, LucPplyE, LucPplOR, the
25 luciferase of *Photinus pyralis*, the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the luciferase of *Luciola mingrelica*.

24. A DNA molecule according to Claim 20 wherein, for the encoded amino acid sequence, the corresponding
30 wild-type luciferase is selected from the group consisting of LucPplGR, LucPplyG, LucPplyE, LucPplOR, the luciferase of *Photinus pyralis*, the luciferase of *Luciola cruciata*, the luciferase of *Luciola lateralis*, and the luciferase of *Luciola mingrelica*.

25. A DNA molecule according to Claim 21 wherein,
for the encoded amino acid sequence, the corresponding
wild-type luciferase is selected from the group
consisting of LucPplGR, LucPplyG, LucPplyE, LucPplOR, the
5 luciferase of *Photinus pyralis*, the luciferase of *Luciola
cruciata*, the luciferase of *Luciola lateralis*, and the
luciferase of *Luciola mingrelica*.

26. A DNA molecule according to Claim 22 wherein,
for the encoded amino acid sequence, the corresponding
10 wild-type luciferase is selected from the group
consisting of LucPplGR, LucPplyG, LucPplyE, and LucPplOR.

27. A mutant luciferase according to Claim 23
wherein, for the encoded amino acid sequence, the
corresponding wild-type luciferase is selected from the
15 group consisting of LucPplGR, LucPplyG, LucPplyE, and
LucPplOR.

28. A DNA molecule according to Claim 24 wherein,
for the encoded amino acid sequence, the corresponding
wild-type luciferase is selected from the group
20 consisting of LucPplGR, LucPplyG, LucPplyE, and LucPplOR.

29. A DNA molecule according to Claim 25 wherein,
for the encoded amino acid sequence, the corresponding
wild-type luciferase is selected from the group
consisting of LucPplGR, LucPplyG, LucPplyE, and LucPplOR.

25 30. A DNA molecule according to Claim 26 wherein,
for the encoded amino acid sequence, the corresponding
wild-type luciferase is LucPplGR.

31. A DNA molecule according to Claim 27 wherein,
for the encoded amino acid sequence, the corresponding
30 wild-type luciferase is LucPplGR.

32. A DNA molecule according to Claim 28 wherein,
for the encoded amino acid sequence, the corresponding
wild-type luciferase is LucPplGR.

33. A DNA molecule according to Claim 29 wherein,
35 for the encoded amino acid sequence, the corresponding
wild-type luciferase is LucPplGR.

34. A DNA molecule according to Claim 30 wherein the encoded mutant luciferase is selected from the group consisting of LucPplGR-R₂₁₅H, -R₂₁₅G, -R₂₁₅T, -R₂₁₅M, -R₂₁₅P, -R₂₁₅A, -R₂₁₅L, -R₂₂₃L, -R₂₂₃Q, -R₂₂₃M, -R₂₂₃H, -V₂₂₄I, -V₂₂₄S, -V₂₂₄F, 5 -V₂₂₄Y, -V₂₂₄L, -V₂₂₄H, -V₂₂₄G, -V₂₃₂E, -V₂₃₆H, -V₂₃₆W, -Y₂₃₇S, -Y₂₃₇C, -L₂₃₈R, -L₂₃₈M, -L₂₃₈Q, -L₂₃₈S, -L₂₃₈D, -H₂₄₂A, -F₂₄₄L, -G₂₄₅S, -G₂₄₅E, -S₂₄₇H, -S₂₄₇T, -S₂₄₇Y, -S₂₄₇F, -I₂₄₈R, -I₂₄₈V, -I₂₄₈F, -I₂₄₈T, -I₂₄₈S, -I₂₄₈N, -H₃₄₈N, -H₃₄₈Q, -H₃₄₈E, -H₃₄₈C, -S₂₄₇F/F₂₄₆L, -S₂₄₇F/I₂₄₈C, -S₂₄₇F/I₂₄₈T, -V₂₂₄F/R₂₁₅G, -V₂₂₄F/R₂₁₅T, -V₂₂₄F/R₂₁₅V, -V₂₂₄F/R₂₁₅P, 10 -V₂₂₄F/P₂₂₂S, -V₂₂₄F/Q₂₂₇E, -V₂₂₄F/L₂₃₈V, -V₂₂₄F/L₂₃₈T, -V₂₂₄F/S₂₄₇G, -V₂₂₄F/S₂₄₇H, -V₂₂₄F/S₂₄₇T, and -V₂₂₄F/S₂₄₇F.

B. FIELDS SEARCHED

Electronic data bases consulted (Name of data base and where practicable terms used):

APS, MEDLINE, BIOSIS, LIFESCI, EMBASE, WPI, BIOTECHDS, CA

search terms: luciferase#, muta? or modif?, gene# or sequence#, beetle# or firefl?, pyrophorus or plagiophthalmus, photinus or luciola
